
Installing Artio JoomSEF Plugin for Fireboard

Posted by admin - 2007/06/05 05:04

This is a beta SEO plugin for Fireboard 1.0.X. Backup your site before installing. We are not responsible for lost data.

The latest update makes this plugin work with JoomSEF 2.0. Pierpaolo Romanelli added the necessary code to make this possible. Thanks Pierpaolo. If you have some free time check out his website <http://www.pierpaoloromanelli.com>

Important: This extension requires ARTIO JoomSEF 2.0 or later. Use the built-in installer capability to install the extension package.

For JoomSeF versions under 2.0 use beta 0.2 below

Step 1: Get the File

First download the needed files.

[artio_sef-com_fireboard-beta1.0.zip](#)

Step 2: Intall

Go to the admin area of your site. Go to Components->ARTIO JoomSEF->Install. Your done.

If you have been using the forum before installing this plug-in you will have to remove all of the urls that have been already generated. Just go to Components->ARTIO JoomSEF->View/Edit SEF Urls. Type forum in the Filter SEF Urls: text box. This will only show the Forum urls and you can delete them. When they are all deleted you can go back to your forum

This forum is using the plugin. Also check out <http://www.ronbassett.com>

Important: This extension requires ARTIO JoomSEF 1.3.0 or later. Use the built-in installer capability to install the extension package.

Old versions are posted below:

Version beta 0.2

This version has been updated removing the showcat, view, post from the end of the URL. If you have beta0.1 installed you will have to uninstall it first. All new categories and post will be fixed correctly. Although urls made with beta0.1 will still contain showcat, view, post until the urls are deleted so it can recreate them.
